GUIDE TO CHANGES

BML-QDG-QA-071-G01

A. WITHIN THE SCOPE OF THE SOP

Manufacture of Product (changes to Product, API, or excipients)	• Process (times, mixing, speeds, temperatures, order of addition,) • Removal /replacement/ addition of API or excipient • Formula amounts, overages • Batch size, production scale • Shelf life, expiry • In-process controls • Supplier of API or excipients • Specification, grade of API or excipient • Equipment, critical device • Manufacturing suite • Cleaning methods of processes • Calibration frequency or limits • Shape or dimension of product • Imprints/debossing or other markings on products • Fill weight or volumes • Primary pack (product contact container or closure) – change in supplier, material, pack size or shape
Quality Assurance	• Specification • Specification limits • Laboratory equipment, test methods or test locations • Regulatory changes • Stability protocol • Sterility protocol • Outsourcing of services
Facilities	• Utilities • Building /structural work • Replacements of parts on existing equipment and utilities • Environmental monitoring system
Finished Products	• Changes to a final pack e.g. leaflets, labels, cartons • Secondary or tertiary packaging – change in supplier, material, pack size or shape
IT System	• Any change to a local or global IT system (software, hardware and firmware)
Logistics	• Transportation route e.g. sea to air • Logistic service provider • Distribution or storage e.g. via multi-market warehouse

BIOMEDICAL LTD

CONTROL COPY

B. GUIDE TO CHANGE CONTROL MANAGEMENT

LEVEL 1[**unlikely** to have detectable impact]		
CATEGORY	EXAMPLE	REQUIRED ACTION
Changes to composition and components	quantitative only (except Immediate Release: colour, flavour, ink; Modified Release: + preservative)	Stability testing: one batch on long-term stability data reported in annual report.
Manufacturing – Process Changes	changes to parameters (e.g. mixing times, Autoclaving time, operating speeds) within application/validation ranges	one batch on long-term stability data reported in annual report
Manufacturing – Equipment Changes	1) Change from non-automated or non-mechanical equipment to automated or mechanical equipment to move ingredients; and 2) Change to alternate equipment of the same design and operating principles of the same or of a different capacity.	one batch on long term stability
LEVEL 2 [**could have** significant impact]		
CATEGORY	EXAMPLE	REQUIRED ACTION
Changes to composition and components	quantitative > Level 1, plus any change in excipient grade (Modified Release: + change in excipient specifications	Stability testing, and sterility testing.
Manufacturing – Process Changes	changes to parameters (e.g. mixing times, autoclaving time, operating speeds) outside application/validation ranges	stability, sterility
Manufacturing – Equipment Changes	change to equipment of **different design and different operating principles**	stability, sterility
Level 3 **likely** to have significant impact.		
Changes to composition and components	quantitative > Level 2, plus addition or deletion of an excipient (except for a colour, flavour, ink)	Requirements for level 3 include stability testing, sterility testing **and an in vivo study**.
Manufacturing – Process Changes	Change in the type of process, such as from sugar drying to direct compounding with the sugar.	stability, sterility, and Bioequivalent study
